

GEOMETRIZATION FOR PATTERN RECOGNITION,
DATA ANALYSIS, DATA MERGING,
AND MULTIPLE CRITERIA DECISION MAKING

5

ABSTRACT OF THE DISCLOSURE

An analyzer/classifier/synthesizer/prioritizing tool for data comprises use of an
admissible geometrization process with data transformed and partitioned by an input process
into one or more input matrices and one or more partition classes and one or more scale
groups. The data to be analyzed/classified/synthesized/prioritized is processed by an
10 admissible geometrization technique such as 2-partition modified individual differences
multidimensional scaling (2p-IDMDS) to produce at least a measure of geometric fit. Using
the measure of geometric fit and possibly other 2p-IDMDS output, a back end process
analyzes, synthesizes, classifies, and prioritizes data through patterns, structure, and relations
within the data.
